EINSTEIN Matchmaker

Companies

have real technical problems

match

Researchers

have the methods to solve them

They rarely find each other. We match them so the problem gets solved.

Architecture

- code
- Jev agent (Mozaik)
- LLM agent (Mozaik)

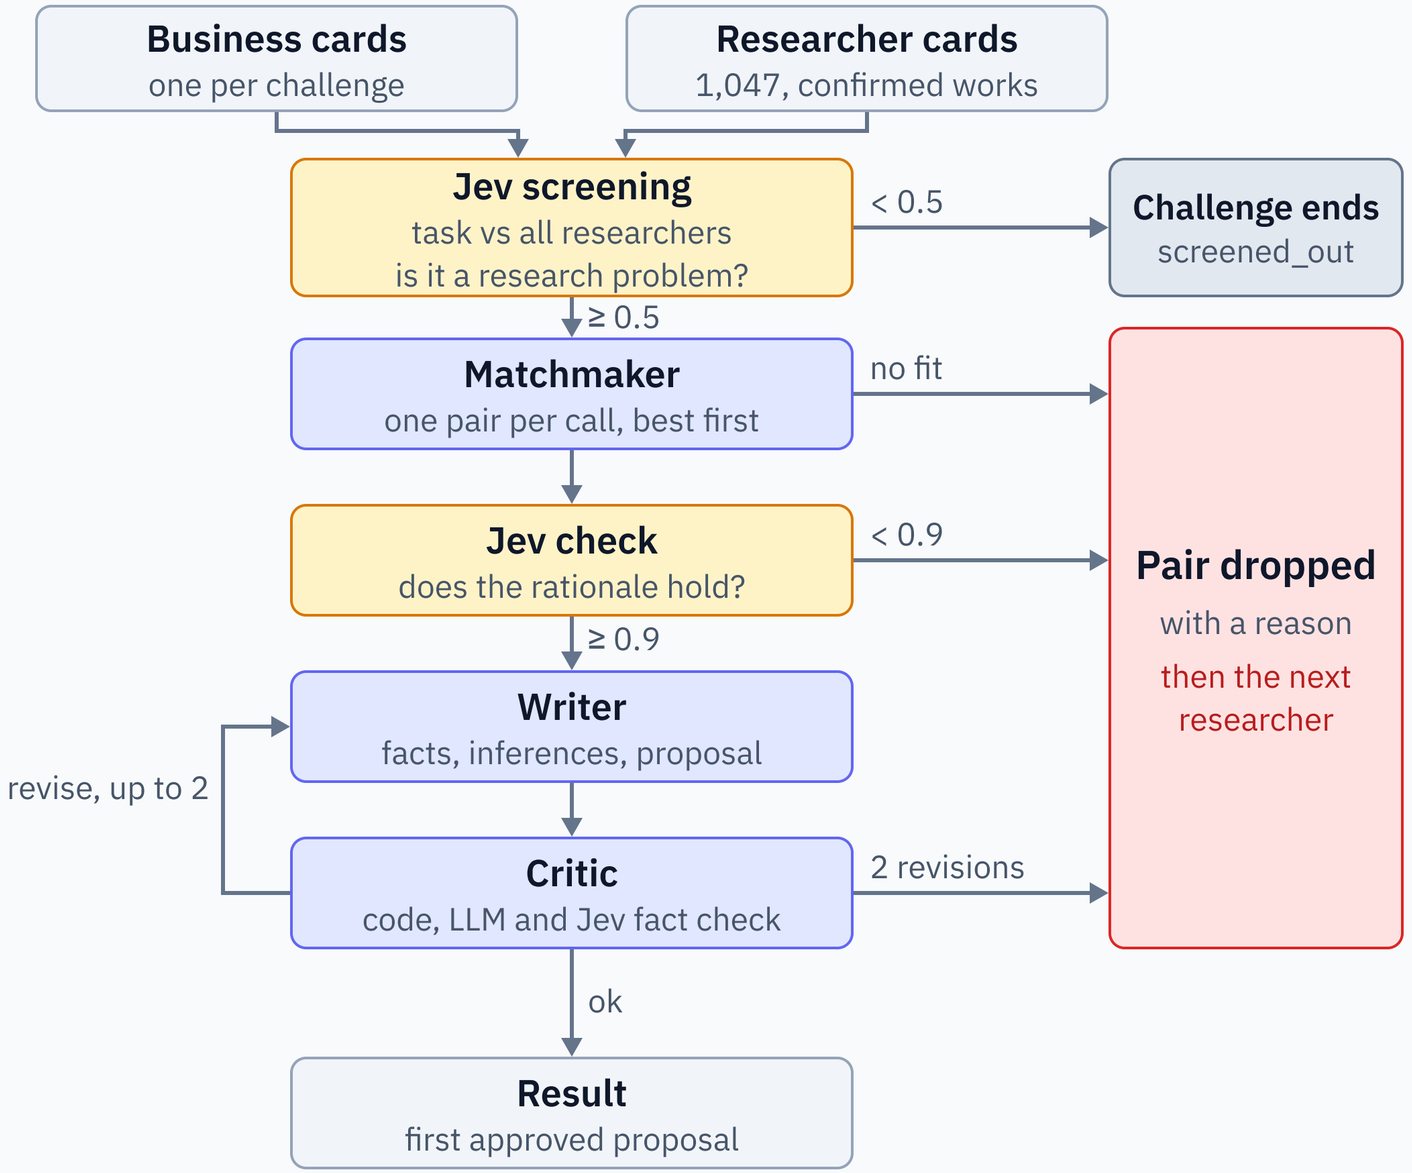

Agents working at once

Pairs of one challenge go one by one; 3 challenges run in parallel

Screening: researcher batches as parallel Jev agents, up to 6 requests at once

Critic: an LLM agent and a Jev agent together

Up to 4 LLM agents at a time

One match, from data to proposal

THE RESEARCHER

Bojana Novaković

Assistant Professor, Traffic Engineering, University of Novi Sad

Predicts bus travel and arrival times from GPS data, e.g. “Comparing LSTM and GRU Architectures for Stop-Level Arrival Time Prediction Using Historical AVL Sequences”

Audited the GPS data archive of the Novi Sad bus operator

THE COMPANY

Subotička Mobilnost a.d.

Mobility software, 112 employees, Subotica

GPS pings from 340 buses every 10 seconds since 2021, never used to predict arrivals

Three Romanian cities want stop screens accurate within 90 seconds, 85% of the time

OUR PAIR · JEV 0.96 · CHECK 0.91 · APPROVED BY CRITIC

“Testing live bus-arrival predictions for PassengerView”

First step, an eight-week benchmark: “Replay actual display timing; measure the percentage within 90 seconds overall, by city, horizon, peak period and confirmed disruption/weather conditions.”

The Critic in action

LinguaBot × Stefan Dragić: Serbian support search misses 18% of queries; the company wants below 5%

1 · WRITER, FIRST DRAFT

Go/no-go: “below 5% separately on the bank-client population”

The other client groups are evaluated, but nothing they show can stop the project.

2 · CRITIC BLOCKS IT

“The bank-only aggregate gate can pass despite unacceptable telecom performance or persistent failures on within-word mixing and unseen terminology”

3 · REVISED, APPROVED

Adds “separate pre-agreed gates for telecom, within-word mixing and unseen terminology”

The Writer revises its own draft; the Critic approves version 2.

Run 2026-10-31T14-15-54: the Critic blocked each of the three first drafts once, all revised versions were approved; both versions are kept in the trace

How it fits EINSTEIN

EINSTEIN NETWORK

Company challenge → researchers

A technology-transfer coordinator at UNS or NTP Novi Sad enters a company’s challenge and gets proposals with sources, open questions and the Critic’s record. A person decides whether to introduce the two sides.

EINSTEIN STARS

Researcher → company challenges

The same agents in reverse: one researcher against all 489 challenges. A computational linguist got 17 matching challenges and 2 checked proposals for $0.32.

RESPONSIBLE USE OF DATA

Only the provided dataset · the system rates a pair’s fit to one task, never a person · availability comes only from what researchers wrote · nothing is sent to anyone automatically

What it costs

$0.10–0.25

One company challenge

1–3 minutes. Jev screens all 1,047 researchers (≈ $0.02), then Matchmaker, Jev check, Writer and Critic with one revision

≈ $0.30

One researcher vs all 489 challenges

EINSTEIN Stars mode, about a minute

$50–120

The whole dataset, 489 challenges

An estimate from 13 challenges we ran, not a measurement

How to make it cheaper

A cheaper model for drafts, the strong one only for the final check

When network data update, process only new or changed challenges

Drop weak pairs before the costly steps

Cache the shared company and researcher text between calls

Technologies

Mozaik 4.2.0
every role is its own agent

OpenRouter
one gateway to all models

GPT-6.1 Sol
Matchmaker, Writer, Critic

Jev 1.14
screening and checks as probabilities

Claude
Claude Code as a developer agent

Codex
developer agent and outside reviewer
